# CompoundMe

Small habits. Big impact. A personal  
finance and habit tracker for Android.

# Small routines have a price tag.

One coffee

**Rp 25,000**

How often

**3x a week**

Cost over a year

**Rp 3.9M**

CompoundMe turns routines like this into numbers you can see, then lets you simulate what happens if you cut back. The figures above are an illustrative example.

# One loop across four screens.

Log in seconds

Check in daily

See the real price

Simulate savings

# One check-in, one expense.

## Build habits

Things you want more of, like exercise or reading. Check in daily and keep the streak.

## Reduce habits

Things that cost money, like coffee. Every check-in also logs the expense, inside one database transaction, so the habit and the money never disagree.

Balances are always computed from transactions and never stored, which removes a whole class of mismatch bugs.

# Never miss twice.

| Day | Status | Decision                         | Streak |
|-----|--------|----------------------------------|--------|
| Sun | Done   | Counts                           | 1      |
| Sat | Done   | Counts                           | 2      |
| Fri | Missed | Grace day used                   | 2      |
| Thu | Done   | Counts                           | 3      |
| Wed | Done   | Counts                           | 4      |
| Tue | Missed | Grace not recovered, streak ends | 4      |

Example: daily habit, read backwards from today

One missed day is forgiven, with at most one grace day per 7 scheduled days.

A second miss in a row, or a miss before the grace day recovers, ends the streak. Alternating patterns break it on purpose.

# Layers that keep the rules testable.

**Presentation** never touches the database.

**Domain** is pure Dart, so streaks and insights are unit-tested fast.

**Data** writes across tables are atomic.

cold start (emulator)

Automated audits also enforce the design system, accessibility labels and error states. Measured on an emulator; real-device testing is still open.

# Rebuilt from scratch, on purpose.

## Local-first

No account. All data stays on the phone.

## Rules, tested

Design tokens and accessibility checks run as tests, not as good intentions.

## Bilingual

Indonesian and English from day one.

Version 1 proved the idea. Version 2 fixed the foundations: data model, interface and release process.
